Platform Interface — Inspired by Paytm

Refund Radar is built on a **familiar, trust-inspiring UI language** that mirrors Paytm's design system — ensuring zero learning curve for existing users. The main dashboard surfaces everything that matters at a glance.

How It Works — Payment Processing

Every transaction on Refund Radar follows a structured, observable flow — from initiation to resolution. The system supports **UPI, Wallet, and Card payments**, with real-time status tracking built into every step.

When any transaction enters a **"Pending" state beyond the defined threshold**, Refund Radar automatically flags it and activates the AI dispute pipeline — no user action required.

Meet Refund Radar — Your AI Dispute Agent

"No more chasing. No more waiting. No more confusion."

The **Refund Radar AI chatbot** is embedded directly inside the transaction experience. The moment a failed or pending transaction is detected, it proactively opens a conversation — no user needs to search for help.

Beyond Refunds — A Full-Service Platform

Refund Radar is more than a dispute tool. It's a **unified service layer** bringing travel, support, and help into a single, cohesive experience — all powered by the same trusted AI backbone.

Lodging a Complaint

Tracking of Complaint

Booking of flight/train

Frequently Asked Questions

Refund Radar is designed to be intuitive, but we've compiled answers to your most common queries for quick reference.

The platform provides 10 scrollable question sets for FAQs, where by clicking on + option , the questions will be answered.

The Impact Is Direct and Measurable

For Users

Anxiety eliminated. No banking jargon, no chasing three parties across 72 hours. Disputes handled automatically, silently, on time.

For Paytm

Directly strengthens **Trust** — Track 1's core pillar. Higher retention, higher transaction frequency, lower churn. Trust compounds into revenue.

For Support Teams

Every autonomous dispute = one fewer inbound ticket. At Paytm's scale, even **10% deflection** in dispute volume = significant operational savings.

"When users know a failed transaction is automatically handled — confidence compounds."
